

# HTML eMail from 4D Write

The image shows two overlapping windows from a Mac OS X environment. The top window is titled "Testing HTML-eMail" and displays a rich text editor with a menu bar (File, Edit, View, Insert, Style, Colors, Paragraph, Format, Tools) and a toolbar. The text in the editor includes: "Dear", "please do some **bold** and some *italic* and some underlineBold.", "Some colors and some Sizes.", "Different fonts like Georgia, Helvetica, Times and MenLo.", "This is a «URL:http://www.mettre.de/smv/ozWR\_eMailMgr.shtml»!". Below the text, an HTML code snippet is highlighted: `<HTML:>`. A blue logo with the text "My Company" is placed in the editor. To the right, an "SMTP-Parameters" table is visible:

Name	Content
mailSender	info@mettre.de
Send_to	oz@mettre.de
Subject	dit & dat
mailCC	
mailBCC	
Reply_to	
SMTP_Host	smtp.mettre.de
SMTP_User	

The bottom window is titled "dit & dat — Eingang" and shows an email client interface. It displays the email header: "Von: Ortwin Zillgen", "Betreff: dit & dat", "Datum: 4. Juni 2010 10:45:18 MESZ", "An: Ortwin Zillgen", "Antwort an: Ortwin Zillgen". A small profile picture of Ortwin Zillgen is shown. Below the header, the email body is rendered, showing the text from the 4D Write editor. The blue "My Company" logo is successfully rendered in the email body. A small blue question mark icon is visible in the email body, indicating a missing image. Orange arrows point from the HTML code in the 4D Write window to the rendered logo in the Mail window, and from the question mark icon to the text "placed picture only works locally".

HTML-Expression works. I needed to load the pictures in Mail

We could include the picture as Base64, but this would break the 32 KB barrier in Internet Commands. Later some time.
